## Image 1: Chest Radiograph – 30/male

Question: What are the findings and likely clinical symptoms?

Answer for Image 1: There are ground glass /hazy ill defined opacities at right mid and lower zone and at left mid zone; they are not dense enough to be consolidation and there is no air bronchogram; no pleural effusion. Such densities in the current epidemic are consistent with viral infection, such as covid. Patient also had cough and phlegm for the previous one week.
